

Reflection

To summarize this issue, wildfires are the main source for poor air quality and how smoke affects citizens and their health. People that live nearby areas that have higher risks of wildfires are more prone to having health issues such as heart diseases, strokes, cancers, and many other illnesses. Also, people that rely very much on wildlife visibly see it get destroyed by climate change every once in a while and getting banned from it to reduce wildfires affects their mental health because they get their sources from there. We discovered that Global Goal 13 and 3 is connected to this issue. Goal 13 is titled Climate Action which means to combat climate change and the way it impacts us by reducing greenhouse gas emissions. We also believe that goal 3 (Good Health and well being) is connected to our issue because our issue affects peoples health and absolutely affects peoples well being.
