

Reflection

In conclusion, the lobster industry of Nova Scotia is a vital part of Nova Scotia's economy and the rising ocean temperatures poses as a threat to the fisheries. The DFO have taken measures to protect the lobsters and their currently stable and healthy but the future of the lobster industry may have a lot of risks due to the rapid increase in ocean temperatures, slowly leading the lobsters to migrate to the north. Lobster harvesters worry that the quality of the lobsters found in the future may have decreased due to the potential risk of diseases, increased stress, increased shell molting and more. This slowly arises problems for Nova Scotia's economy and livelihood. Thus, the DFO have taken measures to protect the species but are yet to take sincere action towards problems related to climate change.
