

AI VS. YOUR CAREER

Maggie & Sivakami

Innovation or Job Killer?

Overview

Who, What, When,
Where, and Why.

Maggie

Who: Workers in industries with repetitive tasks, such as customer service, data entry and manufacturing are most affected, while industries like the technology sector are benefitting from creating and managing AI.

What: Artificial intelligence (AI) is technology that can perform human-like tasks such as writing, analyzing data and creating content.

Where: AI taking over careers and industries is a global issue, with countries all over the world experiencing the effects of AI integration.

When: Although AI has existed for decades, it has rapidly expanded and improved in the past few years with the creation of new AI softwares such as Chat GPT.

Why: This is happening because businesses, innovators, and companies want faster results, lower costs, and a competitive advantage in a rapidly changing economy and world.

Economic Analysis

Artificial Intelligence is actively increasing automation, allowing businesses to replace repetitive human labour with machines, which lowers costs but can reduce career opportunities and effect the economy. This can also increase inequality, because high-skilled workers who use or build AI benefit more, while low-skilled workers are more likely to lose their jobs, which increases the gap between the rich and the poor. AI is also affecting the art and design industry, because many companies are using AI to create their commercials or ads instead of paying artists and designers. AI also impacts trade as well, as countries that lead in AI development gain a competitive advantage in the global economy. - Maggie

Take-Aways

AI acts as both a powerful tool and a driver of job displacement, particularly impacting entry-level and repetitive roles. It gets rid of the need for basic entry-level jobs and reduces monotonous tasks while increasing efficiency. Moreover, this also raises the bar for other workers to provide better performance and higher-value skills, as they now have to demonstrate abilities beyond what AI can do.

At the same time, AI depends on massive data centers that require huge amounts of electricity to run and stay cool. As AI demand rises, data centers consume more power than renewable energy can always supply, increasing reliance on non-renewable sources. As a result, AI's growth not only reshapes jobs but also adds environmental strain beyond the jobs.

Data

Sivakami

- **51% of organizations say AI is reducing their need for entry-level roles**
- **Employment for early-career workers in AI-exposed fields has declined by 16%**
- **Unemployment among young graduates (ages 23–27) rose from 3.25% (2019) to 4.59% (2025)**
- **AI use in the workplace jumped from 30% (2023) to 76% (2025)**

Thank You
