

Fair Trade Coffee Beans

By Maggie & Sivakami

The Case Profile & Conflict - Maggie

Worldwide, coffee bean farmers often live in poverty because global coffee prices constantly change, and they are rarely making fair wages. When the “C-Price” drops, farmers may sell coffee below the cost of production while large transnational corporations continue buying coffee cheaply for profit. The Coffee bean farmer always loses in this scenario despite working incredibly hard, and that’s unfair.

The Free Trade price for coffee is about \$8.00 per pound while Fair Trade coffee costs around \$14.50 per pound. The higher Fair Trade price helps provide fair wages, safer working conditions, and support for communities around the world. Therefore, Fair Trade coffee is the smart and ethical option that helps others.

Maggie

Choice Architecture Playbook

1. Anchoring will be used by showing how little the price difference actually is per cup of coffee. A sign could explain that choosing Fair Trade coffee only costs a few cents/dollars more per drink, making the higher price seem more reasonable and ethical to customers.
2. Social Proof will be used by creating a survey display showing that most customers/adults said they would choose ethically sourced coffee over cheaper but unethical coffee. This encourages customers to follow the masses.
3. Ethical Priming will be used by placing a short story/article in grocery isles or in cafe windows explaining how unstable coffee prices affect coffee bean farming families and how Fair Trade helps provide more stable incomes and safer living conditions. By choosing ethical coffee you're helping somebody out there.

Is It Worth It?

- Fair Trade guarantees coffee farmers receive a fairer and more stable payment for their crops, even when global coffee prices become unstable. This helps families afford necessities such as food, healthcare, housing, and farming equipment while reducing the need to sell crops at extremely low prices.
- Helps fund important infrastructure projects, including drilling wells for clean drinking water. Many coffee growing communities struggle with limited access to safe water, so these projects improve sanitation, reduce illness, and make daily life safer and healthier for families.
- It also supports education by helping build and maintain schools and providing supplies for students. When children have access to education, they are less likely to be forced into working on farms at a young age. Instead of contributing child labour to support family income, children can stay in school and have more future opportunities. This creates a long-term cycle where education replaces the need for child labour.

The Conceptual Shift Narrative & Pitch

Our pitch convinces customers by changing what they pay attention to when they buy coffee. Instead of focusing only on the higher price per bag, we show that the difference is only a small amount per cup of coffee, which makes Fair Trade feel more affordable and realistic. Then we connect that small extra cost to real outcomes, farmers getting fair wages, communities gaining clean water through wells, and children being able to go to school instead of working.

By showing these impacts through simple displays and short messages, customers start to see that they are not just buying coffee, they are supporting better living conditions for real families. We also include what other customers choose, which makes Fair Trade feel like the normal and responsible option. In the end, the pitch makes people feel like choosing Fair Trade is an easy decision because a small extra cost per cup leads to a much bigger positive change in the lives of the workers.
