
Soccer Ball Manufacturing

By: Dyson & Marshall

Case Profile and Conflict

- Soccer balls have been made in south-east Asia for more than 100 years, specifically in Sialkot Pakistan.
- Around 60-70% of soccer balls produced globally are made in Sialkot
- Hand stitching being outsourced those who lived in the rural areas surrounding the city
- Contributes to the large number of child labourers in poor conditions because of the reliance on this one income stream.

Price Comparison

Free Trade (TNC):	\$20.00 / ball
Fair Trade Cert:	\$40.00 / ball
Price Premium:	+\$20.00
(100%)	

Architecture Mechanisms

3 techniques we will use to shift consumer preferences are the following:

- Anchoring
- Default Bias
- Decoy Effect

Anchoring: We will use anchoring to help make our fair trade ball feel more affordable. For example by placing our \$40 less expensive ball on a shelf next to a \$120 professional ball.

Default Bias: By using default bias it pre selects choices for consumers, tending them to stick with it as change requires effort. For example, pre-selecting the fair trade soccer ball for the local teams/schools orders.

Decoy Effect: Using the decoy effect creates a less attractive option making our fair trade ball look like more of a premium product. For example, offering a \$35 machine stitched ball next to our \$40 hand stitched fair trade ball.

Is It Worth It?

YES:

Atlanta Agreement (UNICEF, International Labour Organisation and Sialkot Chamber of Commerce and Industry)

- Already in place, 10% premium in place on soccer balls
- Controlled by a democratic committee of factory workers
- Issued Textbooks, built hospitals
- Funded the private airline AirSial
- Guaranteed Minimum Wage

The Conceptual Shift

Our architecture changes consumers perception of value by combining different techniques to make the higher price of a fair trade soccer balls feel fairer. Using methods like anchoring and default bias, present the fair trade ball as a trusted and recommended choice. QR codes on our balls allow customers to learn where the ball was made, who stitched it and how fair wages support workers and their families. By connecting buyers to real stories and ethical production, consumers see the purchase as more than just buying a soccer ball, they see it as supporting positive change which makes the higher price feel justified.
